

BCL2L1

Comparative exon–domain boundary matrix · signed distance to nearest representative-domain edge

Which exon–domain boundaries are comparable across species, and does each species place that boundary at the same distance from a domain edge?

		1
<i>H. sapiens</i>		0
<i>M. musculus</i>		0

Columns: comparable-boundary groups (CBG) · "t" marks a tentative alignment mapping · near-edge threshold ±5 aa

Exact domain edge No comparable boundary mapped Species analysis pending
