

BCL2L1

Signed distance from each comparable exon–domain boundary to the nearest representative-domain edge, per species

Do the species place the same comparable boundary at the same distance, and on the same side, of the nearest domain edge?

Exact domain edge

Marker lane per species ○ upper · Homo sapiens ○ lower · Mus musculus

Solid connector: supported cross-species mapping · dotted connector: tentative mapping, equivalence not established

Open marker: distance to a domain start edge · filled marker: to a domain end edge · negative: upstream of that edge
