

BCL2L1

Cross-species primary-protein MSA overview · 2 species, 249 alignment columns

Where do the selected primary proteins agree, where do residues differ, and where does one species carry an insertion or deletion?

Pairwise identity 88.1% over 219 ungapped columns · 26 mismatch columns · 30 indel columns

Variable blocks are runs of at least 5 consecutive non-identical columns. Identity is computed on ungapped columns only and describes sequence similarity, not functional equivalence.
