

PTPN11 · local genomic neighbourhood

One row per species, target locus centred on a shared slot grid

Which annotated loci flank the target gene, in which transcription direction, and are the same neighbours present across species?

Loci are placed by annotated neighbour rank, not by genomic coordinate; the spacing carries no distance information. The arrowhead is the annotated transcription direction. Local synteny is supporting evidence for locus identity and genomic context; it does not by itself establish isoform or event identity.

Species shown: 3 of 3 in this dataset · complete neighbourhood: Homo sapiens, Mus musculus, Rattus norvegicus · partial: none · no neighbourhood available: none.
