

# PTPN11

Cross-species primary-protein MSA overview · 3 species, 597 alignment columns

Where do the selected primary proteins agree, where do residues differ, and where does one species carry an insertion or deletion?

Pairwise identity 99.0% over 597 ungapped columns · 6 mismatch columns · 0 indel columns

Variable blocks are runs of at least 5 consecutive non-identical columns. Identity is computed on ungapped columns only and describes sequence similarity, not functional equivalence.
