

PTPN11 · isoform alignment · *Rattus norvegicus*

2 protein models (2 curated) · 597 alignment columns · MAFFT · primary NP_001171064.1 / NM_001177593.1

Where along the alignment do the protein isoforms of this gene differ from the primary protein?

■ primary protein (aligned residues) ■ alternative model (aligned residues) ■ residue differing from primary ■ gap in this isoform ■ variable column (models disagree)

■ gap density across models ■ conservation (consensus fraction) ■ exploratory candidate interval

Major variable blocks: 1 · major gap blocks: 1 · 4 variable and 4 gap-containing columns of 597.

Conservation is the fraction of the shown models carrying the column's most frequent residue, so a gapped column scores low.

One plotted mark spans 2 alignment columns at this width; a difference or gap mark is drawn where any column within it qualifies.

Filled marker: curated model · open marker: predicted model · identity: percentage of aligned residue pairs identical to the primary protein.

Exploratory analysis; no isoform difference shown here is a validated splicing event.
