

Detailed Post-InterPro Evidence and Boundary Pipeline

A - Cluster and coordinate inputs

B - Ingestion and ownership

C - Annotation role separation

D - Boundary observation engine

E - Regenerated coordinate evidence register

F - Comparative and availability layer

G - Canonical consumers

Scientific guardrail: the register copies intervals, relations and classifications from the core source tables; it does not recompute them. Before cluster annotation, the same run-local register contains exon-protein intervals and marks domain-dependent evidence pending_cluster; post-cluster execution replaces that phase view.
